

Scenario: You are a busy programmer who is looking to be more environmentally friendly. You find it hard living in a city to find easy ways to recycle products correctly. You would like an app to help guide you to becoming more environmentally friendly.

Task 1: Lookup whether or not aluminum can be recycled.

Task 2: Find your closest recycling center.

Task 3: Find when your next recycling pickup day is.

Notes:

What changes should I make to my application?

- Add a way for the app to know when your next recycling day is. Maybe use your current location?
- Add the most common recyclable items to the recycling search tool.
- Have maps open to Apple or Google maps so the user can see what times the recycling center is open.

What should I keep the same on my app?

- The simplicity. Only having three tabs make it easy to navigate.
- The search bar is a great tool.
- The calendar is easy to read and understand, leave it that way.
